

Engineering Signals and Systems in Continuous and Discrete Time

Fawwaz T. Ulaby Andrew E. Yagle
University of Michigan
Second Edition

The Book

- Combines theory and application demonstrating the usefulness of the theory for solving real-world problems.
- Four-color iconic design that stimulates interest, supports efficient navigation through the presentation, and calls attention to the main take-home concepts.
- Two new chapters added: Chapter 9, Filter Design, Multirate and Correlation and Chapter 10, Image Processing, Wavelets, and Compressed Sensing.
- New concepts added include compensator feedback configuration (Chapter 4); energy spectral density, group delay, expanded coverage of exponential Fourier series (Chapter 5); filtering of images, Hilbert transform, single-sideband (SSB), zero and first-order hold interpolation (Chapter 6); the Cooley-Tukey FFT (Chapter 7); bilateral z-transform and use for non-minimum-phase deconvolution (Chapter 8).
- Thirty-two LabVIEW modules that use GUIs with sliders to select various parameter values for clarifying many of the more complicated examples, and are integrated for problem solving assignments.
- A rich set of diverse and challenging problems. The second edition now contains 585 problems, with many new problems added in each chapter.
- LabVIEW®, MathScript RT, an add-on module for LabVIEW is included with the LabVIEW Student Edition packaged with this book. LabVIEW MathScript RT gives you the ability to either run the .m files included with the book or create new ones from scratch.
